Does incentive compatibility change with the agent's intelligence?

Each agent debates itself / argues once; pooled over 9 judges; committed liars only (gpt-5 audit); 95% item-bootstrap intervals. Orange: GPT-5.6 Sol at effort none, low, medium, high. Dashed gray: the judges with no argument (blind baseline). Hollow gray: the same agent with all prompted liars (conceding and refusing ones kept). ASD = mean reward arguing the truth minus lying.
